

1. 암호화

- 반복적 Hash 사용하기 (pbkdf2 구현)
 - 예제에서는 랜덤한 salt 값 활용, 실제로는 salt 값 고정 필요함

pbkdf2.js

```
const crypto = require('crypto');

crypto.randomBytes(64, (err, buf) => {
  const salt = buf.toString('base64');
  console.log('salt:', salt);
  crypto.pbkdf2('비밀번호', salt, 100000, 64, 'sha512', (err, key) => {
    console.log('password:', key.toString('base64'));
  });
});
```

콘솔

```
$ node pbkdf2
salt: OnesIj8wznyKgHva1fmulYAgjf/0GLmJnwfy8pIABchHZF/Wn2AM2Cn/9170Y1AdehmJ0E5CzLZULps+da
F6rA==
password: b4/FpSrZulVY28trzNXsl4vVfh0KBPxyVAvwnUCWvF1nnXS1zsU1Paq2p68VwUfhB0LDD44hJ0f+tL
e3HMLVmQ==
```
